

Lacquering

REINÆRDT can, in addition to the traditional veneers, also deliver doors that are finished with a range of top coatings. White lacquer is one of those options.

The white lacquered doors can be delivered without lacquering or they can be treated with RAL colours 9010 and 1013. REINÆRDT possesses a highly environmentally friendly lacquer system. The applied lacquer is an acrylate lacquer and is composed of three layers. This results in the desired outcome.

Advantages of the production method are less discolouration, more resistant to scratches and also more resistant to chemicals (cleaning detergents). The door is machine-sanded in between treatments and results in a smooth top layer.

By using UV-lacquers and the state of the art composition techniques, REINÆRDT Deuren bv can produce a white lacquered door that satisfies the needs of the customer.
